

Problem analysis of Divide And Conquer

YAO ZHAO

Hilbert Curve

W_2 consists of four W_1 structures with the lower-left and the lower-right ones are 90 degree rotated clockwise and counter-clockwise, respectively; the upper ones have the same structure with W_1 . Connect the four structures with 3 unit lines.

W_3 consists of four W_2 structures with the lower-left and the lower-right ones are 90 degree rotated clockwise and counter-clockwise, respectively; the upper ones have the same structure with W_2

Hilbert Curve

- ▶ This rule has been devised by a mathematical philosopher David Hilbert (1862 – 1943), and the resulting curve is usually called a Hilbert Curve named after him. He once talked about a space filling method using this kind of curve to fill up a square with 2^k sides.

For each vertex p on the Hilbert curve, we define the coordinates of p to be the location of the square of p in the squares matrix, and we define the serial number of p to be the vertices count on the curve from the beginning to p .

For example, when the coordinates of p is $(3,4)$ and the order is 2, the number of p is 10;
when the coordinates of p is $(5, 1)$ and the order is 3, the number of p is 59.

W_1

W_2

W_3

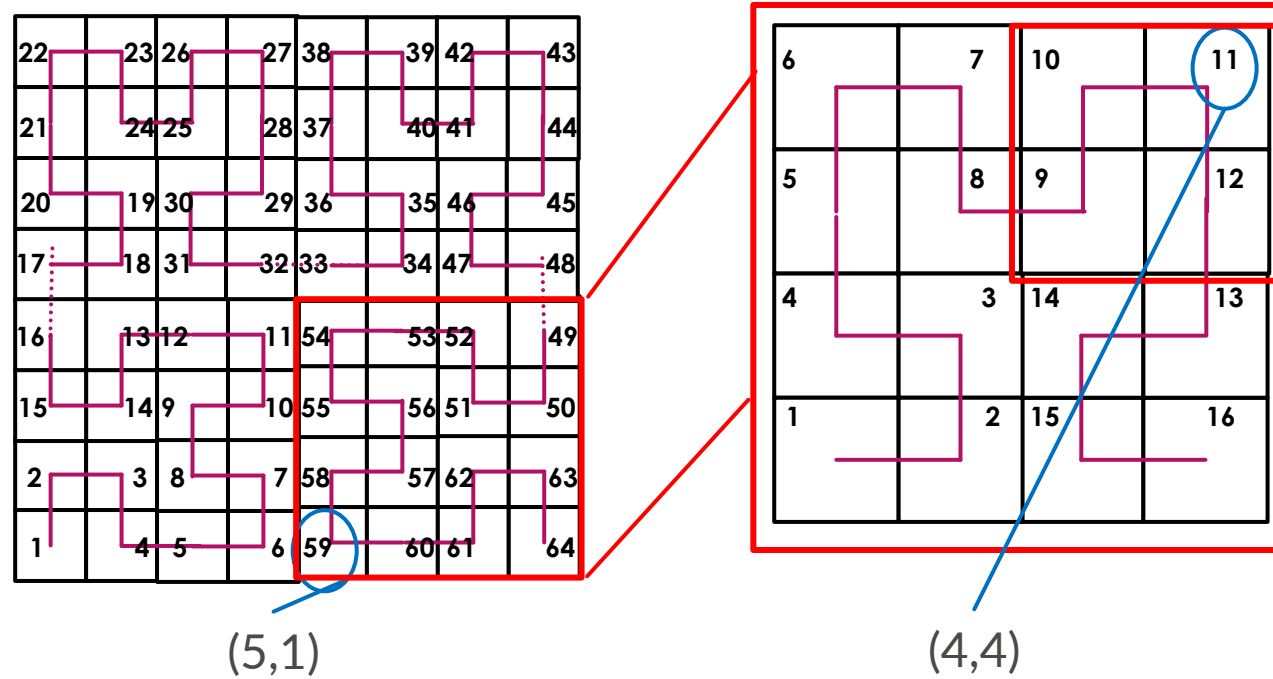

Given the order of the Hilbert curve and the coordinates of p , can you figure out the number of p ?

Problem analysis

W_n consists of four W_{n-1} structures

Problem analysis

How to map (5,1) to (4,4)?

Step 1: Divide the W_3 to 4 parts

Step 2: Find which part (5,1) is in

W_3 is a 8*8 square matrix

Step 3: get offset value according part number

Part 4 case

Part 2

Part 1

Part 3

(5,1) is in part4

Offset = 3*16 = 48

Each element-48

coordinates x-4

Part 4

(1,1)

(4,4)

W₂

y = -x

Observe the part4 and W₂

The coordinates and the number are flipped symmetrically by the line y = -x

$$x' = 4 + 1 - y$$

$$y' = 4 + 1 - x$$

(5,1) → (1,1) → (4,4)
offset flip

Step 3: Part 1 case

Observe the part1 and W_2

The coordinates and the number are flipped symmetrically by the line $y = x$

$$x' = y$$

$$y' = x$$

Offset = 0

Part 2

Part 3

Part 1

Part 4

Step 3: Part 2&3 cases

Further analysis: W_2

How to map (4,4) to (2,2)?

Step 1: Divide the W_2 to 4 parts

Step 2: Find which part (4,4) is in

- (x,y) {
- $x \leq 2 \ y \leq 2$ Part 1
 - $x \leq 2 \ y > 2$ Part 2
 - $x > 2 \ y > 2$ Part 3
 - $x > 2 \ y \leq 2$ Part 4

Step 3: get offset value according part number

Part 3 Offset = $2 * 4 = 8$

Each element-8

coordinates $x-2 \ y-2$

$(4,4) \rightarrow (2,2)$

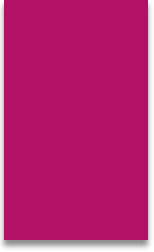

Base code: W_1

coordinates

number

(1,1)	1
(1,2)	2
(2,2)	3
(2,1)	4

```
w[3][3] = {{0,0,0},  
           {0,1,2},  
           {0,4,3}};
```

```
public static long HilbertNumber(int n, int x, int y) {  
    if(n==1)  
        return w[x][y];  
    int m = 1<<(n-1);  
    if(x<=m) {  
        if(y<=m)  
            return HilbertNumber(n-1, y, x); //Part 1, x' = y y'=x  
        else  
            return m*m + HilbertNumber(n-1, x, y-m); //Part 2, coordinates offset: y-m  
    } else {  
        if(y>m)  
            return 2*m*m + HilbertNumber(n-1, x-m, y-m); //Part 3, coordinates offset: x-m y-m  
        else  
            return 3*m*m + HilbertNumber(n-1, m+1-y, m+1-(x-m)); //Part4, coordinates offset: x=x-m  
                                                                    //x' = m+1-y, y' = m+1-x  
    }  
}
```
